

As my teammate Ricardo has said. There are three ways to search. We have tried to make it as practical and as possible for the user.

-Dar a buscar

Here we can give it directly to search. And we find the three possible ways.

By postal code, you only have to enter the code in our search engine in this case we are in Puerto de la Cruz. So we introduce it. And we give him a search. As we can see, the Puerto de la Cruz area and even Orotava appear, and it marks the pharmacies.

We can also search by our location. The user would simply give search and it would show us our position and the closest pharmacies.

And finally, a list of pharmacies that, depending on their area, the user will be able to see if they are open.

We also seek to try to give the user a profile with a pharmacy that we call a trusted pharmacy. It is the pharmacy that we always go to and we will give the user the opportunity to chat directly with it to find out if their medications are available. Thus the user does not have to keep many queues and will not have to scroll unnecessarily.

If you want to know more about our application, this would be our repository where you can find everything related. The programmer's manual, the user's manual with all the features and all the information.

Thank you very much for your attention
